

CIS 150 is an introductory course for computer information systems students. This course provides an overview of information systems and their organizational functions. During this course, I learned topics regarding SDLC, BPM, emerging technologies, and basic web development skills (HTML, CSS, & JavaScript). Our assignments were presented using Cengage and required me to debug HTML and CSS. Bugs within the HTML may cause minor visual issues or deface the entire website.

My Portfolio website is a good demonstration of a few of my HTML skills. CIS 150 has provided me with the understanding to build a website for myself and professionals to view. Many preconfigured HTML and CSS stylings can be found, such as my navigation bar, but I would have a much harder time creating it without the course. JavaScript has also been used for viewing my classwork section. When clicking on a class, a menu pops up, and visitors can view/download specific files.
